Precision Universal Joint

PRECISION UNIVERSAL JOINT

## Sit universal joints with plain or needle roller bearings Type "E" - "H" (DIN 808)

Of this series both single and double joints are available. Types E are with sliding bushes while type H has needle roller bearings.

Joints with plain bearings are available in 2 versions:

- types E to DIN 808;
- types EB to DIN 808/7551

Joints with roller bearings are available in 2 versions:

- types H to DIN 808;
- types HB to DIN 808/7551

They all consist of a star wheel core and 2 half joints with fork ends. Between the pins of the star wheel and the holes of the forks, 4 wear-resistant sliding bushes (for type E) or roller bearings (type H - high speed) are fitted in.
The 4 bushes have holes for lubrication and each one contains a grease reserve.
The hermetic structure prevents lubricant losses and impurity entry.
Neither lubrication or maintenance is required for type H (high speed joints with roller bearings) as their bearings are lubricated for life.

Joints with plain bearings - type E - are for middle-low speeds and where there are shock loads. For high speeds and relatively low torques types with roller bearings $(\mathrm{H})$ are recommended. Both versions offer high efficiency, silent running, low friction, coefficient at competitive prices.
All rubbing surfaces are hardened and ground.
Maximum working angle is $45^{\circ}$ for single joints and $90^{\circ}$ for double joints.
Maximum speed is 1.000 rpm for type E , while type H can exceed 4.000 rpm .

All versions are also supplied in telescopic versions.

High speed precision joints with needle roller bearings
Series "H" (DIN 808)

- Roller bearings lubricated for life. No maintenance required.
- Precise and versatile, silent and smooth running; wide application field.
- Max. angle: $45^{\circ}$ type "H", $90^{\circ}$ type "HD", max. speed 4.000 rpm.
- Special executions upon request.

[^1]
## Selecting criteria

Matching one single joint with two shafts (of which the driving one is rotating at a constant speed), it forms an angle which causes a periodic variation of the driven shaft, exactly four fluctuations per revolution.
The difference between the maximum and the minimum speed of the driven shaft depends on the angle formed by the two shafts. The difference grows when increasing of the angle $\alpha$.
To have a homokinetic transmission, you have to fit either two opposite single joints (paying attention that the two central yokes lie on the same plaine and the angles are equal) or a double joint. The irregularity caused by the former articulation is cancelled by the latter. The overall length resulting from the coupling of the two single joints is even more reduced using a double joint. In other words, the double joint is to be considered the shortest homokinetic transmission.
For low speed applications (max 1.000 rpm ) joint with plain bearings (rubbing bearings) are suggested: types E/EB. They are able to support shock loads, drive reserves, irregular runnings and relatively high torques. The working angles must be reduced in operation between 500 and 1.000 rpm .
For high rotation speeds, relatively low torques or wide angles, joints with needle roller bearings (type V - H) are preferred. They can reach 5.000 rpm always relating to the angle.

## How to read diagrams

The joint capacity to transmit a regular torque at a constant load with no shocks for a more or less long period, mainly depends on the number of revolutions per minute and the inclination angle $\alpha$ of the two axes.
The following diagrams are based upon the criteria belon.
Each curve corresponds to the joint size (outside diameter D) and represents the torque that the joint can transmit depending upon speed and working angle $\alpha$.
The diagrams can be directly read if angle $\alpha$ is $10^{\circ}$; for wider angles, torques are reduced, therefore the values are to be corrected using correction factors (F) relating to the angle shown in the table.

## Note:

Diagrams' values are merely indicative. Each application has its own particular motion characteristics, such as: shock loads, motion reversals, connected masses, type of starting, presence of elastic joints, stops and starts, etc. We, therefore, suggest calling our technical department.

## Diagram for joints <br> Series "H" - High Speed

Torque Mt in [ Nm ]

| WORKING ANGLE <br> " $\alpha$ " | $5^{\circ}$ | $10^{\circ}$ | $15^{\circ}$ | $20^{\circ}$ | $25^{\circ}$ | $30^{\circ}$ | $35^{\circ}$ | $40^{\circ}$ | $45^{\circ}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CORRECTION FACTOR <br> "F" | 1,25 | 1,00 | 0,90 | 0,80 | 0,70 | 0,50 | 0,40 | 0,30 | 0,25 |

## Example

- Power: $5,5 \mathrm{~kW}$
- rpm: $2300 \mathrm{~min}^{-1}$
- With working angle $\alpha=10^{\circ}$, Factor $\mathrm{F}=1,00(5,5 \mathrm{~kW}: 1,00=5,5 \mathrm{~kW})$ we get point P and Torque MT $=23 \mathrm{Nm}$ corresponding to joint size $D=28 / 29 \mathrm{~mm}$ (type 05H, 1HB)
- With working angle $\alpha=25^{\circ}$, Factor $F=0,70(5,5 \mathrm{~kW}: 0,70=7,85 \mathrm{~kW})$ we get point P 1 and Torque $\mathrm{MT}=33 \mathrm{Nm}$ corresponding to joint size D = 32 mm (type 1H, 3HB).

Consider that:

$$
\begin{array}{ll}
\text { MT }=9.550 \times \frac{\text { Power }[\mathrm{kW}]}{\mathrm{rpm}\left[\mathrm{~min}^{-1]}\right]} & {[\mathrm{Nm}]} \\
\text { MT }=7.020 \times \frac{\text { Power }[\mathrm{CV}]}{\mathrm{rpm}\left[\mathrm{~min}^{-1}\right]}[\mathrm{Nm}]
\end{array}
$$
