### Description

Spring-loaded variable speed pulleys types 11.101 and 11.104 are usually mounted onto the input side of the motor shaft end; the driven pulley is mounted onto the driven shaft. The output speed is determined by the diameter of the driven pulleys. Often additional gearboxes are not necessary.

### Speed adjustment

The motor with the variable speed pulley is, for instance, mounted onto an adjustable slide. The variable speed belt is pushed into or pulled out of the spring-loaded variable speed pulley by changing the axis distance between the two shafts. Thus, the effective running diameter of the belt in the variable speed pulley and the speed of the driven pulley are changed. Motor slide, motor rocker and belt tighteners enable adjustment. Fine tuning of the speed is always possible by using a threaded spindle. The output speed range of SIMPLABELT variable speed drives (1 : 3) depends on the effective diameter of the driven pulley. The output speeds possible are indicated on pages 8 and 13. The power to be transmitted of the different pulley sizes at different motor speeds are also indicated on these pages.

For shock loaded operation a higher safety factor must be provided. The use of a larger variable speed pulley can be necessary. In case of doubt, please contact Lenze.

SIMPLABELT has been the name for variable speed belt drives for years and it is well established in national and international engineering.

Well-known machine and system manufacturers have used SIMPLABELT variable speed drives successfully for many years, even under difficult operating conditions.

### Simplabelt variable speed pulleys type 11.101

Power range: 0.37–18.5 kW at  $n_1=1500 \text{ min}^{-1}$

Thanks to their design – cast iron disc pulleys on both ends – and their high rotating mass, the variable speed pulleys type 11.101 provide good damping features which are advantageous for the use with changing loads, for instance for clock-pulse operating machines.

We recommend to use variable speed pulleys, if harsh operating conditions and exposure to humidity or dust are to be expected.

The pretension required for power transmission is generated by the disc springs which are located on both sides of the disc pulleys.

The forces resulting from the torque transmission are taken up by a well dimensioned serration. By this, the surface pressure is far below the permissible limit and thus the service life is very long.

### Variable speed pulleys must be re-lubricated depending on their application.

#### Simplabelt variable speed pulleys type 11.104

Power range: 0.37–3kW at  $n_1=1500 \text{ min}^{-1}$

With this type, the disc pulleys are made of a light-metal alloy especially developed for pulleys. Their main characteristic is a low moment of inertia.

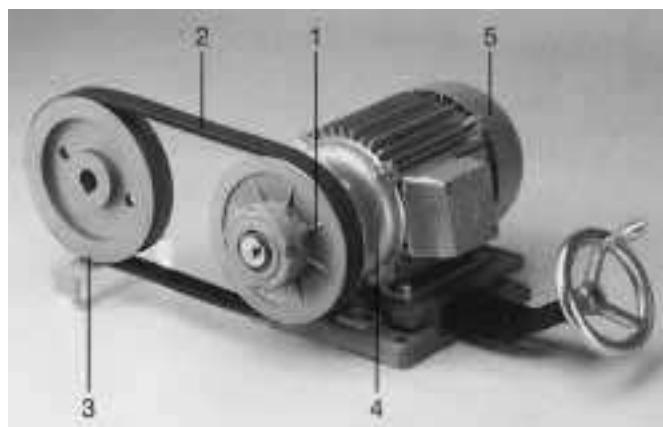

We also offer the economical type 11.104 for operating conditions where a low moment of inertia is favourable because of high switching frequencies or reversing operation.

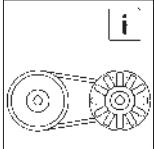

The pretension required for the power transmission is here generated by cylindrical pressure springs which are located rotation-symmetrically on both sides of the disc pulleys.

The variable speed pulleys are life lubricated and do not require further maintenance.

#### SIMPLABELT variable speed drives, design 1:3

SIMPLABELT variable speed drives, design 1:3 consist of a spring-loaded pulley (1), a variable speed belt with an especially bendable inner toothed (2), driven pulley (3), motor slide (4) and a three-phase AC motor to IEC standards (5).

## Variable speed pulleys

### Product information

#### Simplabelt variable speed pulleys type 11.213/218

##### Operation principle

The main part of variable speed pulleys type 11.213/218 is the slide fit. The coated hub as four-side polygon profile combined with disc pulleys made of aluminium cast iron is well established in mechanical engineering.

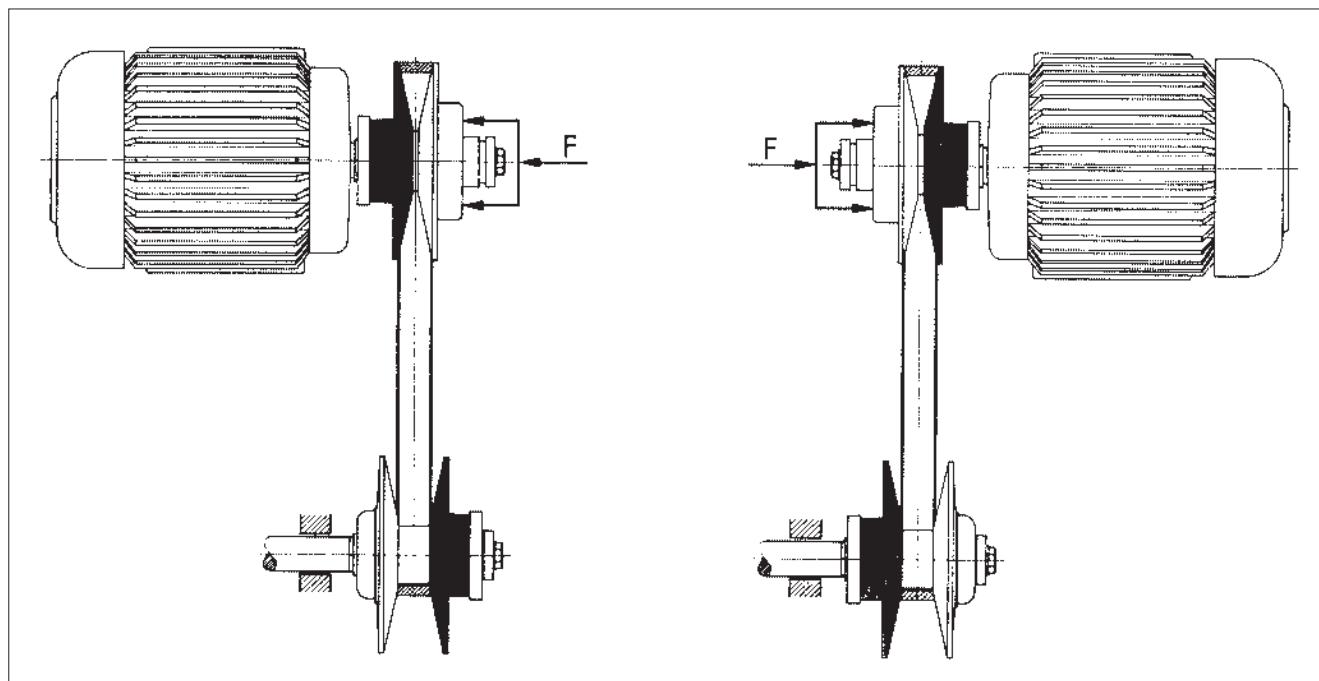

##### Advantages:

- large torque transmission surfaces, i.e. low surface pressure
- self-centering because of symmetrical backlash compensation, i.e. no toppling of disc pulleys

- even profile edges, i.e. very quiet running
- absolutely maintenance free
- long service life

The pretension required for power transmission is generated by screw springs which are located rotation-symmetrically and can be varied by changing the number of springs. All components are made of corrosion-resistant material and enable application even under difficult environmental conditions.

A version with hard-coated belt surfaces is available for application under unfavourable conditions.

6

#### U type

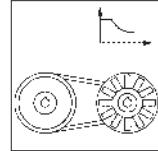

The mechanically adjustable variable speed pulley is mounted onto the driving shaft (motor shaft), the spring-loaded variable speed pulley is mounted onto the shaft to be driven. If the mounting is changed, the performance data of the drive will change. If so, please contact Lenze. All variable speed

#### Z type

pulleys can be mounted as U or Z type (except size 40). Please observe that the fixed disc pulleys (dark in the figure) must be mounted diagonally. Thus, the belts are aligned in any position. Simplabelt variable speed pulleys can be mounted independently of the mounting position.

## Variable speed pulleys

### Calculation of axis distance

The tables on pages 6-8 to 6-10 and 6-13 to 6-14 list the smallest axis distance for different inner diameters of the driven wheel depending on different inner belt lengths.

Use the following equations for the calculation.

$$A \text{ or } A_1 = \frac{1}{2} \left[ L_w - 1.57 (D_w + d_w) - \frac{(D_w - d_w)^2}{L_w} \right]$$

$$s = A_1 - A$$

$$L_w = 2 A + 1.57 (D_w + d_w) + \frac{(D_w - d_w)^2}{4 A}$$

$$L_w = L_i + x$$

Variable speed belt size	22	28	37	47	55	70
X in mm	28	38	47	61	75	85

A = smallest axis distance for largest variable speed pulley diameter (max. output speed)

A<sub>1</sub> = largest axis distance for smallest variable speed pulley diameter (min. output speed)

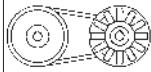

s = adjustment path, roughly applicable: large adjustment path for small driven pulleys, small adjustment path for large driven pulleys. The tables on pages 6-8 to 6-10 and 6-13 to 6-14 give the values for the adjustment path.

D<sub>w</sub> = effective diameter of larger pulley (can be largest effective diameter of variable speed pulley or effective diameter of driven pulleys).

d<sub>w</sub> = effective diameter of smaller pulley (can be smallest effective diameter of variable speed pulley or effective diameter of driven pulleys). For d<sub>w</sub> values see tables on pages 6-7, 6-12 and 6-19.

L<sub>w</sub> = effective length of variable speed belt

L<sub>i</sub> = inner length of variable speed belt

## Variable speed pulleys

### Motor slide

Simplabelt motor slides are rugged and very flat. The surface is very strong and ensures smooth running of the variable speed pulleys. The adjustment range is limited by two stops.

4 slide sizes in 4 designs are available.

#### Normal design

The spindle with belt wheel is bent by 30° to the top.

#### U design

Like normal design but the spindle is bent to the bottom.

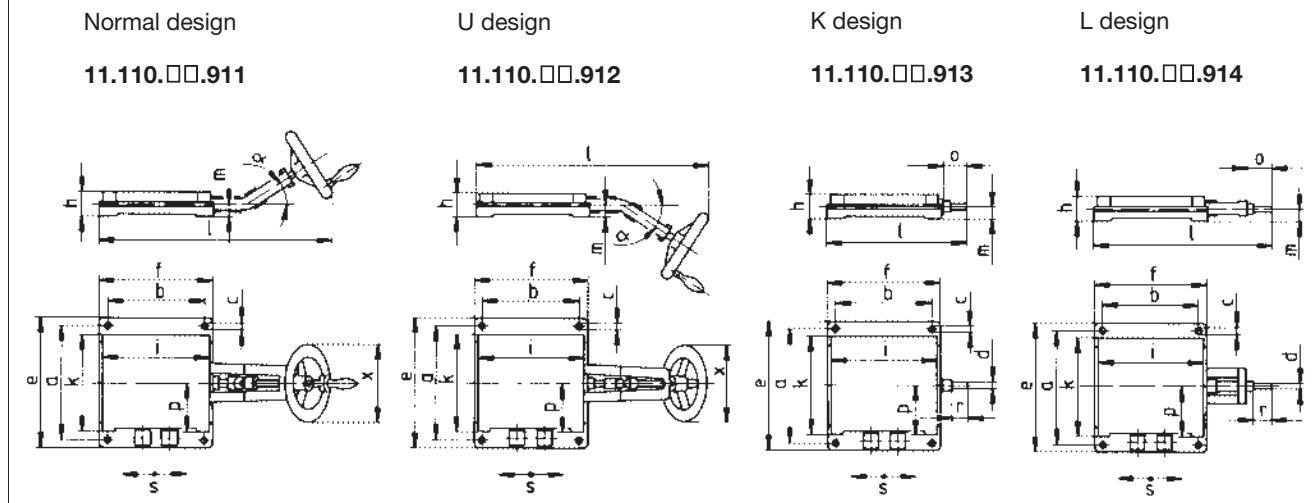

#### K design

Short spindle

This design is necessary to extend the spindle.

#### L design

Long spindle – for chain and bevel wheel adjustment.

s\* indicates the max. adjustment path. The adjustment path required is calculated according to the equation on page 6-15.

Roughly applicable: Large adjustment path for small driven pulleys, small adjustment path for large driven pulleys

Dimensions in [mm]

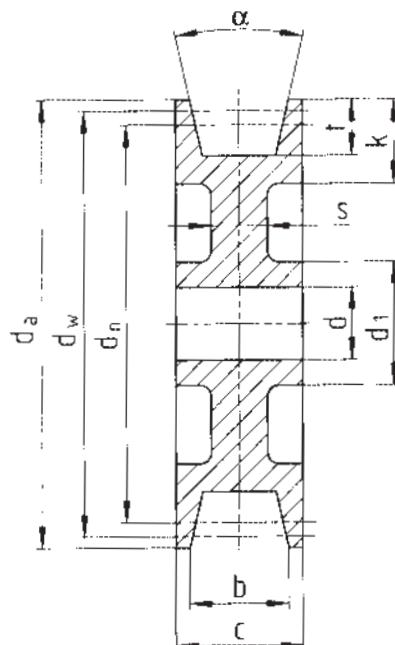

## Variable speed pulleys

### Driven pulleys

Simplabelt driven pulleys are made of cast iron and are statically balanced. The running grooves match the dimensions of the Simplabelt variable speed belts. The size designation refers to the corresponding spring-loaded variable speed pulley type 101 or 104.

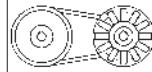

The driven pulley is mounted onto the machine shaft to be driven or the input shaft of a reducing gearbox.

The ready-bored driven pulleys are delivered with keyway to DIN 6885 sheet 1 and ISO fit H 7. Therefore the shaft fit should be ISO-k 6. Please indicate in your order designation, rated diameter and bore.

## Variable speed pulleys

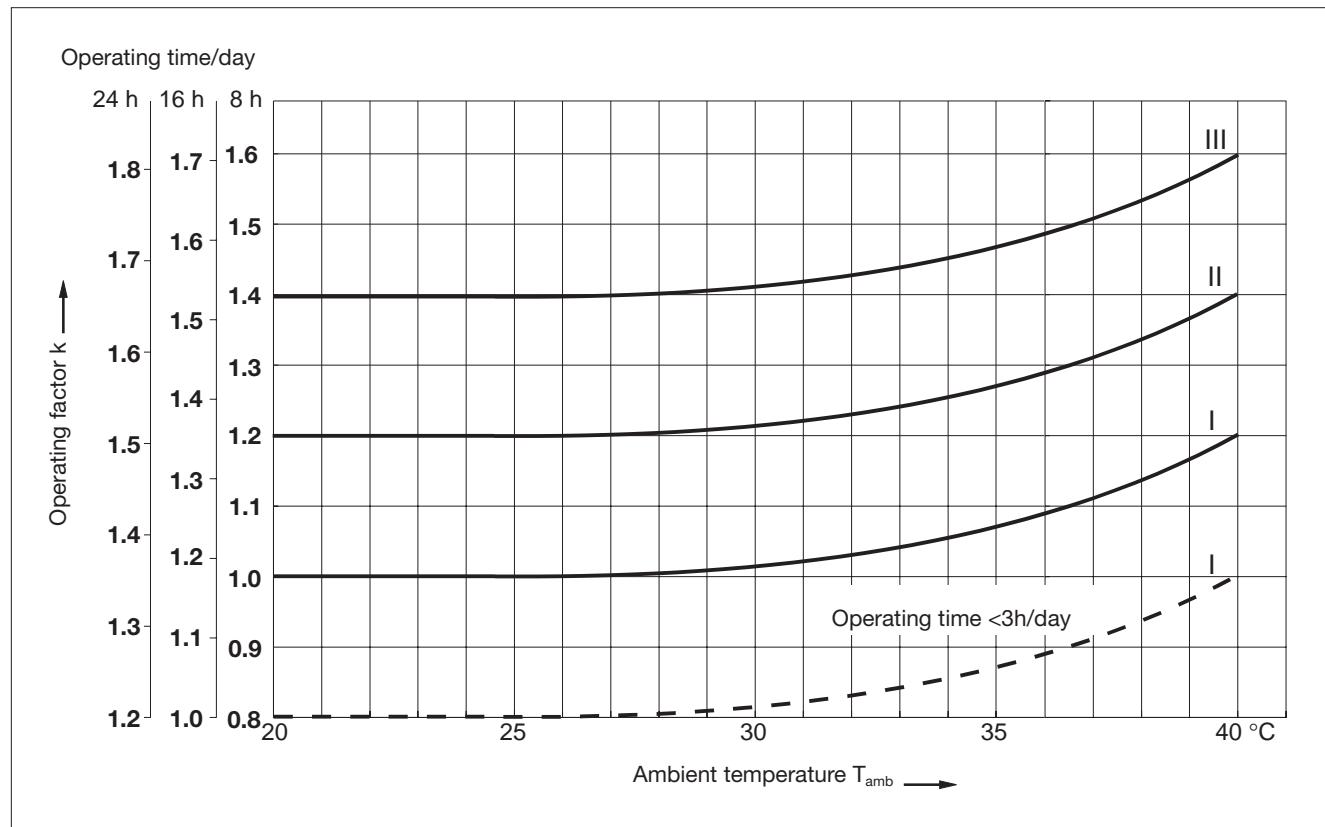

Type 11.213/218

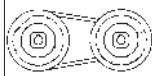

### Selection

Simplabelt variable speed pulleys are selected according to the power  $P_2$  and output speeds  $n_2$  required. It is important to consider that the power and torque required for the machine to be driven might be different for max. and min. speeds. The power to be transmitted can be obtained from

the corresponding power characteristic of the variable speed pulleys. The power data given in these characteristics refer to an operating time of 8h/day and 100 % duty time and shock-free operation. For other operating conditions, please see the operating factors in the diagram.

## Variable speed pulleys

Type 11.213/11.218
